

ABSTRACT

The present invention continuously monitors the amount of oxygen dissolved in a beverage in a beverage storage tank in a beverage filler. Gas is continuously
5 sampled via the vent holes 28 and the vent pipe 29 from the space part inside the beverage storage tank 1 of the beverage filler and is supplied to the oxygen measuring apparatus 40. The oxygen measuring apparatus 40 includes the oxygen measuring device 45 and measures the
10 concentration of oxygen gas of the delivered gas. Based on the concentration of oxygen gas, it is monitored whether or not the amount of oxygen dissolved in the beer inside the storage tank is at or below a predetermined level. Further, the beverage is sampled from a supply
15 channel supplying the beverage to the beverage storage tank so that the concentration of oxygen in the beverage is measured and monitored.
